ABSTRACT:

PROBLEM TO BE SOLVED: To provide a surface inspection apparatus for disk, by which both the surface defect inspection and the tilt inspection of the disk can be performed simultaneously, which shortens the inspection time, and which can reduce the installation cost.

SOLUTION: The apparatus is provided with a disk rotation means 51 which supports and turns a disk 1, a defect inspection means 54 by which the disk 1 is irradiated with light from a light source 2, in which its reflected light or its transmitted light is detected by detection parts 52, 53 and which the defect on the inspection face of the disk 1 is detected on the basis of a change in a quantity of detected light, and tilt inspection 55a to 55d by which the disk 1 is irradiated with the light from the light source, in which its reflected light is detected by the detection part and by which the inclination state on the inspection face of the disk 1 is detected from the light receiving position of the detected light.

ABSTRACTED-PUB-NO: JP 09281054A

BASIC-ABSTRACT:

The method involves operating simultaneously a defect inspecting unit (54), consisting of a pair of detectors (52,53), and tilt inspecting units (55a-55d) on a disk (1) rotated by a rotating unit (51). A halogen light source (2) irradiates light into the rotating disk, after which the reflected light is detected optically by the detectors.

The defects on the control surface of the disk is then detected by the inspecting unit from the detected variation of the quantity of light reflected on the disk surface. The inclination state of the disk control surface is determined by the inspecting units from the detected optical light-receiving positions of the detectors.

USE/ADVANTAGE - For manufacture of DVD disk. Shortens inspection time by performing disk surface discontinuity and tilt inspections simultaneously, thereby reducing installation costs. Positions defect inspecting unit along line beam direction of light source to balance visual field intensity, thereby improving discrimination

accuracy between defective and non-defective portions of disk surface.
